

Introducing the SOTA Head Amplifier:

Take the Measure of Your Moving Coil

John Curl's patented circuitry
Lowest noise consistent with
low distortion

Cylindrical steel enclosure for
immunity to RFI and hum
Three-position impedance switch

The triumph of the moving coil cartridge is upon us. Oddly, this triumph occurred without enormous support from the perennial 'weak link' in the circuit —the step-up device. Historically, the technology which made the moving coil pre-eminent has always outstripped that of the companion amplifier or transformer. Today, with the major breakthrough achieved by the new breed of 'super' moving coils, the problem becomes more

pressing: how to evaluate the top of the class without an equally top-class booster amplifier?

Our solution: the SOTA Head Amp, designed by the foremost specialist in solid state phono circuitry: John Curl. For the first time, there is now a pre-pre-amp more than equal to even the most advanced moving coils. The SOTA Head Amp allows you to take the true measure not only of your cartridge, but of your entire phono system.
